Same objective, two search strategies
HV ratio (NSGA-II / grid) = 0.9911
Dense grid (500 evals)
NSGA-II / pymoo (1200 evals)
NSGA-II / from-scratch (cross-check)
Expected modularity $\mathbb{E}[Q]$ (= $-f_2$, maximise)
$f_1 = \varepsilon$ (privacy loss, minimise)
